

SlugStock

Buglist

- When a note is added, spaces in the note are replaced with underscores.
- PythonAnywhere causes the site to lag sometimes (from 1-3 second delay up to 10 seconds sometimes)
- Texts and emails do not always get sent when expected because PythonAnywhere sometimes shuts off the scheduler process

Incomplete Features

- Chat service never implemented
- We don't have graphs of users past net worths
- We don't have graphs that use recent stock information, only historic stock information
- Wanted giving phone number and provider to be optional, but its still required for making an account

Strange Feature Implementations

- You must specify both your phone number and cell provider in order to receive texts. We looked at some sites that can find the provider for you based on number, but their APIs were not free
- If you follow a stock that is not in the database it takes a long time for historic stock information to be available, so graphs take a while to fill up with data. We decided this was preferable over making the user wait for entire historic stock file to be put into database after adding an unseen stock
- Only displays ticker name, not the company's full name. We scrape the yahoo finance page for the stock, but only wrote the scraper to find the current price of the stock. If there is no price or the page doesn't exist we assume the stock doesn't exist.
